
✓ = beats both baselines with the physics baseline scoring above zero (6 of 7 such heads). ○ = beats both, but raw NWP made ZERO hits there, so the comparison is degenerate and we do not count it as a win (counting every head gives 10 of 12). CSI is the standard rare-event score; absolute values are low because nobody achieves high CSI on point-scale hourly heavy rain without radar. The comparison, not the absolute value, is the claim.
